

iptables-translate

Benefits and need

Users involved

1. New to packet classification framework (User 1)
2. New to nftables but been using iptables for a while (User 2)

Adding up rules in nftables

User1's domain:

- Iptables rulesets all over the internet
- Guides to iptables and nftables
- Wiki

User2's domain:

- User1's domain + Knowledge about packet filtering with iptables

Example rule

In iptables,

```
# iptables -A FORWARD -m mark --mark 2 -j ACCEPT
```

In nft,

```
# nft add rule ip filter FORWARD mark 2 accept
```

Simple Observation

Simple mapping from iptables to nft rule:

iptables -A -----> nft add rule ip filter

-m mark --mark 2 -j ACCEPT -----> mark 2 accept

One more example

In iptables,

```
# iptables -A INPUT -m length --length 40 -j ACCEPT
```

Going by the previous observation, nft rule should be,

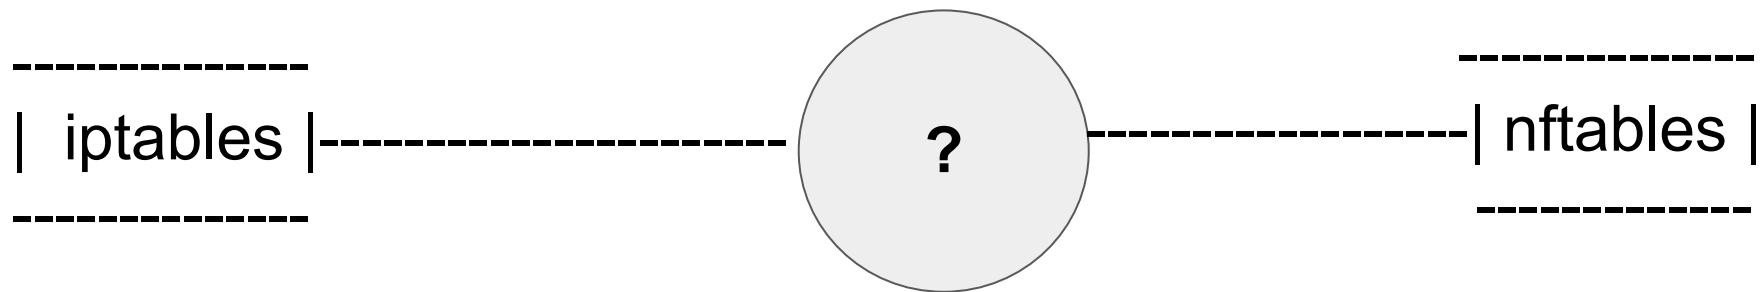

```
# nft add rule ip filter INPUT length 40 accept
```

```
# nft add rule ip filter INPUT length 40 accept
```

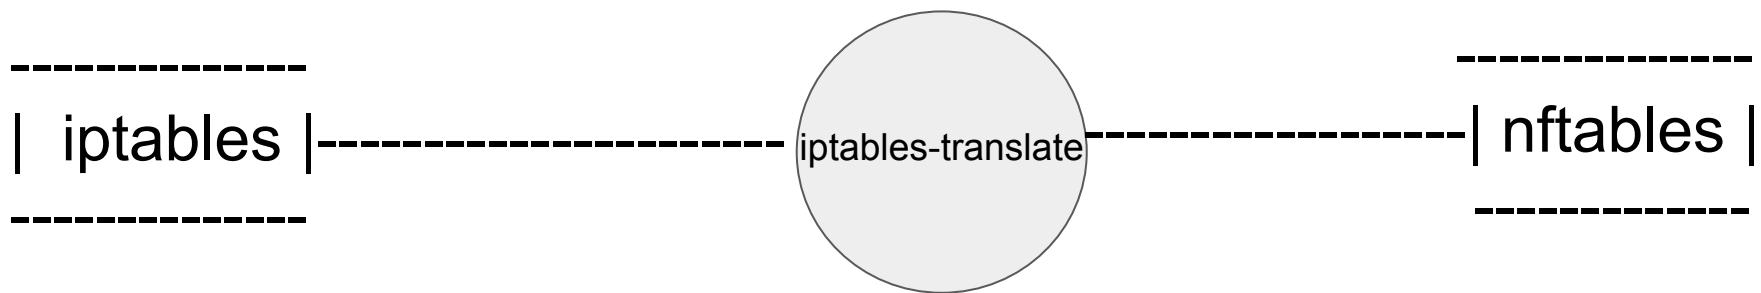

The actual result of the above rule is:

```
<cmdline>:1:26-31: Error: syntax error, unexpected length  
add rule ip filter INPUT length 40 counter accept  
^^^^^
```

Problem

Solution

Usage

```
$ iptables-translate <iptables_rule>
```

Example:

For the previous rule,

```
$ iptables-translate -A INPUT -m length --length 40
```

Result

The correct nft rule:

```
nft add rule ip filter INPUT meta length 40 counter
```

Pros

- User friendly
- Easy to use
- Comes with iptables package

Current scenario

Fully translatable extensions: ~67.8%

Partially translatable extensions: ~20.3%

Untranslatable extensions: ~11.8%
